DAILY-USE

Personal Fitness & Gym Companion

Project Documentation

Developed by: Sai Pavan
Program: B.Tech – Computer Science and Engineering
Institution: VIT-AP University

---

1. Introduction

Daily-Use is a web-based fitness and gym companion application designed to help users manage their everyday fitness activities from a single platform.

The application brings useful fitness-related resources together, including an exercise library, detailed exercise information, gym-related resources, and high-protein recipe suggestions.

The main objective of the application is to make fitness information easily accessible while providing a clean, modern, and user-friendly experience.

The application is designed primarily for people who regularly visit the gym and want quick access to workout and nutrition-related information.

---

2. Problem Statement

People who go to the gym often use multiple sources to find information about exercises, workout techniques, and nutrition.

For example, a user may need one application to find exercises, another website to understand exercise techniques, and another source to find suitable high-protein meals.

This makes the process inconvenient and difficult to manage.

The Daily-Use application addresses this problem by bringing commonly required fitness resources into one centralized platform.

---

3. Objectives

The major objectives of Daily-Use are:

- To create a centralized fitness companion.
- To provide an organized exercise library.
- To provide detailed information about exercises.

- To help users understand different gym exercises.
- To provide protein-rich recipe ideas.
- To create a modern and responsive web interface.
- To make fitness information easily accessible from different devices.
- To create a platform that can be expanded with additional fitness features.

---

4. Main Features

4.1 Exercise Library

The application provides an organized collection of gym exercises.

Users can browse exercises and find information related to different workouts.

The exercise library can help users discover exercises based on their training requirements.

4.2 Exercise Details

The application contains dedicated exercise-detail functionality.

An exercise detail page can provide useful information such as:

- Exercise name
- Target muscle
- Exercise instructions
- Required equipment
- Workout information
- Visual references

This allows users to understand an exercise before performing it.

4.3 Gym Library

The **Gym Library** acts as a centralized section for gym-related information.

It provides users with an organized way to access workout and exercise resources rather than searching through multiple websites.

4.4 Protein Recipes

The application also contains a **Protein Recipes** section.

This section provides food and recipe ideas suitable for users who are interested in increasing their protein intake.

The recipe section can include:

- Recipe name
- Ingredients
- Preparation information
- Protein-focused food ideas
- Easy-to-follow recipes

This connects workout information with nutrition-related resources.

4.5 Responsive Web Interface

The application is designed as a modern web application that can be accessed through different screen sizes.

The interface can be used on:

- Desktop computers
- Laptops
- Tablets
- Mobile devices

4.6 Daily-Use Approach

The application is designed around the idea of being useful on a regular basis.

Instead of functioning only as an exercise information website, the goal is to provide multiple resources that a fitness-oriented user may need during everyday gym and nutrition activities.

---

5. Application Modules

Module 1 – Exercise Library

The Exercise Library is the main collection of workout resources.

Users can browse available exercises and select an exercise to view additional information.

Purpose

- Discover exercises
- Browse workout movements
- Find exercises for different training requirements
- Access exercise information quickly

Module 2 – Exercise Details

The Exercise Details module provides more information about a selected exercise.

Purpose

To help users understand how an exercise is performed and what it is intended to train.

Possible information includes:

- Exercise name
- Target muscle
- Equipment
- Instructions
- Exercise demonstration/reference

Module 3 – Gym Library

The Gym Library provides a dedicated location for gym-related resources.

It acts as a central section of the application where users can access fitness information.

Module 4 – Protein Recipes

The Protein Recipes module focuses on nutrition-oriented content.

It provides users with practical recipe ideas that can complement their fitness routines.

Main purpose

To make it easier for users to find simple protein-focused meal ideas without searching through multiple sources.

---

6. Technology Stack

The application uses modern web development technologies.

Next.js

Next.js is used as the main web application framework.

It provides a structured architecture for developing modern web applications.

TypeScript

TypeScript is used for type-safe application development.

It improves code reliability and makes larger projects easier to maintain.

HTML

HTML is used to structure web content and application pages.

CSS / Styling

CSS and modern styling techniques are used to create the visual design and responsive interface.

JavaScript / TypeScript Logic

Application interactions and dynamic functionality are implemented using JavaScript/TypeScript.

GitHub

GitHub is used for:

- Source-code management
- Version control
- Project hosting
- Development history

Vercel

The application is deployed online using Vercel.

The repository currently contains a deployed production version of the application.

---

7. Project Structure

The repository contains a structure similar to:

Daily-Use/

│

├── public/

│

├── src/

│

├── .gitignore

├── AGENTS.md

├── CLAUDE.md

├── README.md

├── eslint.config.mjs

├── exercise_detail.html

├── gym_library.html

├── next.config.ts

├── package.json

├── package-lock.json

├── paneer-bowl.mp4

├── postcss.config.mjs

└── protein_recipes.html

Important Components

public/

Contains public assets and resources used by the application.

src/

Contains the main application source code.

exercise_detail.html

Provides the exercise-detail interface.

gym_library.html

Provides the gym library section.

protein_recipes.html

Contains the protein recipe section.

package.json

Contains project dependencies and configuration information.

next.config.ts

Contains Next.js configuration.

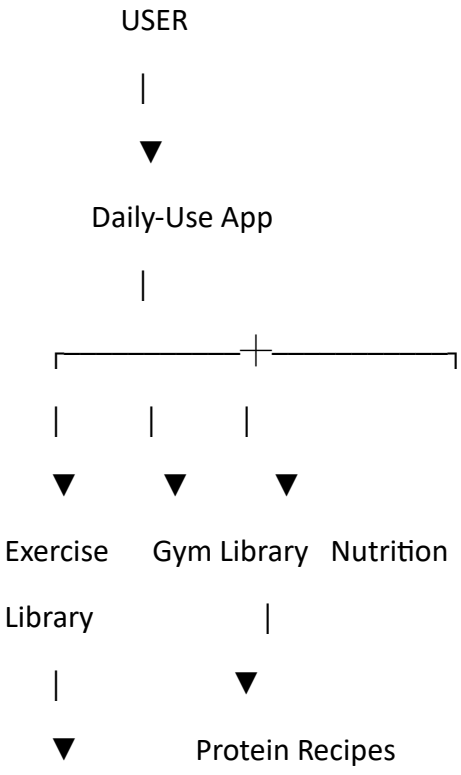

eslint.config.mjs

Contains ESLint configuration for maintaining code quality.

---

8. Application Architecture

The application follows a modern web-application structure.

The user interacts with the main application and can navigate between different fitness-related modules.

---

9. User Flow

A typical user flow can be represented as:

Open Daily-Use

↓

Explore Fitness Resources

↓

Select Exercise Library

↓

Select Exercise

↓

View Exercise Details

↓

Return to Main Application

↓

Explore Protein Recipes

↓

Select Suitable Recipe

This provides a simple flow from workout discovery to nutrition planning.

---

10. System Requirements

Hardware Requirements

The application can be accessed using:

- Desktop computer
- Laptop
- Tablet

- Smartphone

No specialized hardware is required.

Software Requirements

A modern web browser is required.

Supported browsers include:

- Google Chrome
- Microsoft Edge
- Mozilla Firefox
- Safari

An internet connection is recommended for accessing the deployed web application.

---

11. Advantages

Daily-Use provides several advantages:

- Fitness resources are centralized in one application.
- Easy access to exercise information.
- Dedicated exercise-detail pages.
- Gym library for organized fitness resources.
- Protein recipe section.
- Modern web application architecture.
- Responsive design.
- Accessible from multiple devices.
- Can be expanded with additional fitness functionality.
- Online deployment makes the application accessible from anywhere.

---

12. Future Enhancements

The application can be expanded significantly in future versions.

Workout Planner

Users could create personalized workout plans.

For example:

Monday → Chest + Triceps

Tuesday → Back + Biceps

Wednesday → Rest

Thursday → Shoulders

Friday → Legs

Workout Tracking

Users could record:

- Exercise
- Sets
- Repetitions
- Weight
- Duration
- Workout completion

Progress Tracking

The application could display:

- Weight progress
- Strength progress
- Workout consistency
- Personal records
- Training history

Charts could be added to make progress easier to understand.

User Accounts

Authentication could allow users to maintain their own fitness profiles.

Possible information:

- Workout history
- Saved exercises
- Favorite recipes
- Personal goals
- Progress information

Personalized Workout Recommendations

A future version could recommend exercises based on:

- Training goal
- Target muscle
- Available equipment
- Experience level
- Previous workouts

Nutrition Tracking

The recipe module could be extended to include:

- Calories
- Protein
- Carbohydrates
- Fats
- Daily nutrition targets
- Meal tracking

AI Fitness Assistant

An AI-based fitness assistant could be integrated to help users:

- Understand exercises
- Generate workout plans
- Suggest recipes

- Answer fitness-related questions
- Recommend exercises based on available equipment

Progressive Web App

The application could be converted into a PWA so users can install it directly on supported smartphones and computers.

---

13. Security and Privacy

Future versions should follow appropriate security practices when handling user information.

If user accounts and personal fitness data are introduced, the application should implement:

- Secure authentication
- Password protection
- Secure data storage
- Input validation
- Protected user information

The current public application does not require users to provide sensitive personal information simply to browse its fitness resources.

---

14. Deployment

The application is hosted online and has a production deployment.

Deployment Platform

Vercel

Source Code Platform

GitHub

The development workflow can be represented as:

Developer

↓

Source Code

↓

GitHub Repository

↓

Vercel Deployment

↓

Production Web Application

↓

User

This allows the application to be developed through GitHub and made available online through its deployed web version.

---

15. Project Scope

Daily-Use has the potential to evolve from a simple fitness information website into a complete personal fitness platform.

The long-term scope includes:

- Exercise library
- Workout planning
- Workout tracking
- Progress analytics
- Nutrition tracking
- Protein recipes
- Personal goals
- User profiles
- AI fitness assistance
- Personalized recommendations

The modular structure makes it possible to introduce these features progressively.

---

16. Conclusion

Daily-Use is a modern web-based fitness companion designed to bring workout and nutrition resources together in one platform.

The application provides an exercise library, exercise details, gym-related resources, and protein recipe information.

The project demonstrates the practical implementation of modern web development technologies such as **Next.js, TypeScript, HTML, CSS, GitHub, and Vercel deployment**.

Its modular architecture provides a strong foundation for future improvements such as workout tracking, progress analytics, personalized recommendations, nutrition tracking, user accounts, and AI-powered fitness assistance.

The project demonstrates how a simple fitness website can be developed into a complete daily-use fitness ecosystem.

---

17. Project Summary

Category	Details
Project Name	Daily-Use
Application Type	Fitness / Gym Web Application
Domain	Health & Fitness
Framework	Next.js
Programming Language	TypeScript / JavaScript
Frontend	HTML, CSS, Next.js
Source Control	GitHub
Deployment	Vercel
Main Features	Exercise Library, Exercise Details, Gym Library, Protein Recipes
Target Users	Gym and Fitness Users
Platform	Web
Future Scope	Tracking, Analytics, AI, Nutrition, Personalization

---
